12	Energy transferred from hot liquid = energy transferred to ice + energy transferred to cold water	(1)	
	[This may be implicit]

	Use of $E = mL$	(1)	
	Mass of ice required to cool drink to 58 ºC is 2.4×10^{-2} kg **Or** Final temperature using 4 g of ice is 69 ºC	(1)	
	Valid conclusion based on a consideration of their calculated value in comparison with a corresponding value in the question.	(1)	**5**
	<u>Example of calculation</u> Energy transferred from hot liquid = energy transferred to ice + energy transferred to cold water $0.275 \text{ kg} \times 3750 \text{ J kg}^{-1}\text{K}^{-1} \times (71.5 - 58.0)\text{K}$ $= \text{m} \times 3.34 \times 10^5 \text{ J kg}^{-1} + \text{m} \times 4190 \text{ J kg}^{-1}\text{K}^{-1} \times (58.0 - 0)\text{K}$ $\therefore 1.39 \times 10^4 \text{J} = \text{m} \times (3.34 \times 10^5 + 2.43 \times 10^5) \text{ J kg}^{-1}$ $\therefore m = \frac{1.39 \times 10^4 \text{ J}}{5.77 \times 10^5 \text{ J kg}^{-1}} = 2.41 \times 10^{-2}$ kg = 24 g So 4 g would not bring the temperature below the ideal serving temperature.
